A phone call that continues the conversation.

Extend an ongoing HALIA conversation with an outbound call when speaking is the quicker way to collect information or move the process forward.

HALIA keeps the conversation context, the replies and every business decision. The voice service manages the call and exchanges messages with HALIA. Twilio provides the phone line, speech recognition and speech synthesis.

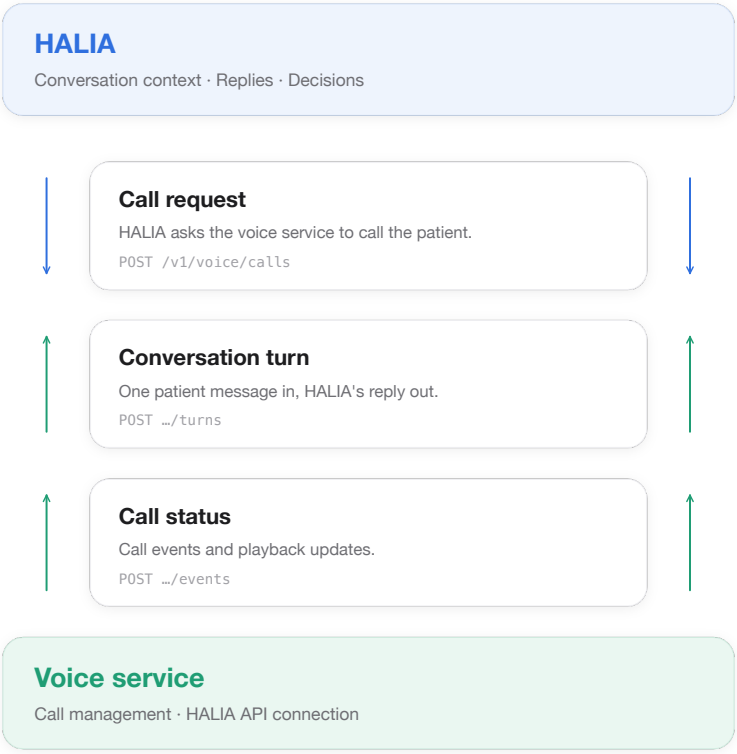

One call, any HALIA process

Booking exams · Report status · Scheduled appointments · Reminders · Cancellations · Exam details and prices. The voice layer only carries the words; what each process does stays in HALIA.

The boundary

Three kinds of message.

Everything else stays on its own side.

One message, one effect: a repeated request never repeats an action.

What HALIA builds

Messages

One patient message in, HALIA's reply out.

Works like a chat API for a phone call.

Call status

Call status and playback updates.

How the call went, separate from the process outcome. Sent for playback is not proof it was heard.

The format

One request, one reply.

The voice service sends what the patient said. HALIA answers with the text to speak.

The example comes from a booking. Every HALIA process uses the same format. Exam, location and available slot are already known from the conversation.

Request

```
POST …/voice-sessions/{voiceSessionId}/turns
Authorization: Bearer <token>
Idempotency-Key: turn_01JDEMO8A1B2C3D4

{
  "turnId": "turn_01JDEMO8A1B2C3D4",
  "turnSeq": 1,
  "input": { "type": "speech", "text": "Giovedì pomeriggio." },
  "previousResponse": {
    "responseId": "rsp_0001",
    "status": "sent_for_playback"
  }
}
```

Reply

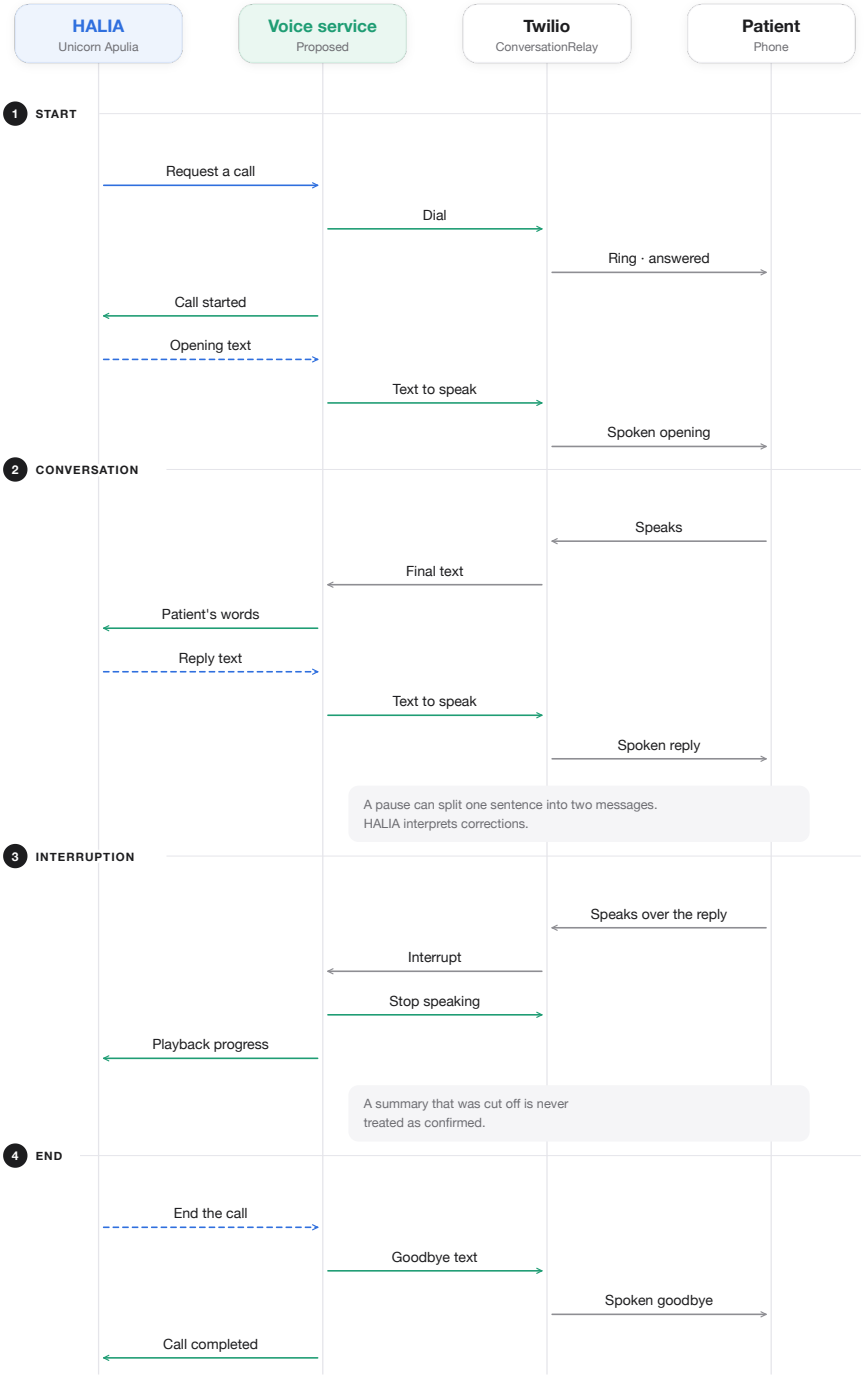

```
{
  "turnId": "turn_01JDEMO8A1B2C3D4",
  "responseId": "rsp_0002",
  "playback": [
    { "text": "Riepilogo: ecografia giovedì 5 novembre
               di pomeriggio, alle quindici e trenta,
               nella sede di Via Dante." },
    { "text": "Vuole che confermi la prenotazione di prova?" }
  ],
  "actions": { "endCall": false }
}
```

The same request sent again is a retry: HALIA returns the stored reply and does not repeat the step. Names, paths and fields are open for discussion.

The call

One call, step by step.

HALIA decides. The voice side carries the words.

Try it

A working mock, ready today.

The mock folder is a stand-in for HALIA that speaks this format, so your team can try it before building anything.

1. **Start the mock**

   In the mock/ folder. Node.js, bash and curl are enough.

   ```
   MOCK_HALIA_API_TOKEN=try-the-format-0001 node mock-halia.mjs
   ```

2. **Run the API simulation**

   In a second terminal, in the mock/ folder. No phone call is made: the script sends the HTTP messages of one call.

   ```
   ./try-it.sh
   ```

3. **Read the result**

   Every request and reply is printed. The simulation follows a booking; at the end the script checks the outcome: one booking for the corrected day, and the conversation back on WhatsApp.

Details are in mock/README.txt. Tested in Italian with synthetic data and a browser softphone; a real phone line and the connection to HALIA come next.
